

Class Activity CO5

1. FileInputStream and FileOutputStream — Single & Bulk Data

```
import java.io.*;

public class FileStreamDemo {

    public static void main(String[] args) throws Exception {

        FileOutputStream out = new FileOutputStream("data.txt");

        out.write('A');

        String data = "Hello Java File Handling";

        out.write(data.getBytes());

        out.close();

        FileInputStream in = new FileInputStream("data.txt");

        int ch;

        while ((ch = in.read()) != -1) {

            System.out.print((char) ch);

        }

        in.close();

    }

}
```

2. FileReader and FileWriter — Single & Bulk Data

```
import java.io.*;

public class FileReaderWriterDemo {

    public static void main(String[] args) throws Exception {

        FileWriter writer = new FileWriter("sample.txt");

        writer.write('J');

        String data = "Java File Reader and Writer";

        writer.write(data);

        writer.close();

        FileReader reader = new FileReader("sample.txt");

        int ch;

        while ((ch = reader.read()) != -1) {

            System.out.print((char) ch);

        }

        reader.close();

    }

}
```

3. Count Number of Lines and Characters

```
import java.io.*;

public class FileCount {

    public static void main(String[] args) throws Exception {

        FileReader reader = new FileReader("sample.txt");

        int lines = 1;

        int chars = 0;

        int ch;

        while ((ch = reader.read()) != -1) {

            chars++;

            if (ch == '\n') {

                lines++;

            }

        }

        reader.close();

        System.out.println("Number of Lines = " + lines);

        System.out.println("Number of Characters = " + chars);

    }

}
```

4. Two Files Read → One File Write using SequenceInputStream

```
import java.io.*;

public class SequenceFileDemo {

    public static void main(String[] args) throws Exception {

        FileInputStream file1 = new FileInputStream("file1.txt");

        FileInputStream file2 = new FileInputStream("file2.txt");

        SequenceInputStream sequence =

            new SequenceInputStream(file1, file2);

        FileOutputStream output =

            new FileOutputStream("combined.txt");

        int ch;

        while ((ch = sequence.read()) != -1) {

            output.write(ch);

        }

        sequence.close();

        output.close();

        System.out.println("Two files combined successfully.");

    }

}
```
